# Experience a Reimagined and Streamlined Primary Care Referral Process with Vim Order Assist

Vim's Order Assist solution gives the right context at the right time to assist care teams in the selection of high-performing, in-network specialists directly within EHR referral workflows. **No more static referral lists or poor patient experience** due to out-of-network or low-quality referrals.

During an active order workflow in the EHR, Vim Order Assist will auto-populate patient information already entered into the EHR such as home address and specialty into filterable search fields without leaving the existing workflow. Returned results include relevant details such as proximity to the patient. And with EHR write-back upon referral selection, care teams enjoy fewer clicks and less burden. Order Assist can also be accessed manually within the Vim Connect hub. Details can be entered into search fields with results as outlined above. In the manual workflow, chosen specialist details can be copied and pasted into the user's desired location within the EHR. **See more on the pages that follow.**

Unlock powerful insights at the point of care and within existing EHR order workflows ensuring in-network, high-quality specialists are selected for exceptional patient experience.

Encourage continued care adherence with powerful search filters including proximity to patient's home address.

Drive standardized behavior to support a consistent clinic experience and results while maintaining physician or care team choice in selecting the best referral for patient's specific needs.
