

# Prior Authorization Workflows Without a Portal

Explore Vim's Scalable Prior Authorization Application

Vim's **Prior Authorization** application provides an end-to-end in-EHR prior auth workflow without the phone-fax-portal push. Experience delivery of real-time prior auth requirements with code lookup, case submission, and status check functionality all in one place.

## Learn more about this solution:

**Enable a single point of access** to patient-specific health plan data and prior authorization requirements (from payer and third-party sources) delivered when it's needed - at the point of care.

**Modernize EHR workflows** with a context-aware connection that uses active clinical orders to trigger and auto-populate prior auth checks when available.

**Simplify entire authorization process** with in-app code lookup, approval requirements, case submission, and status search and update (if available from payer and third-party sources).

**Unify management of prior authorization status checks** with searchable reference number (if available from payer and third-party sources).

**Reduce administrative burden** within existing EHR interface by replacing phone calls, faxes, portals, and other manual prior authorization steps.
