

Streamline Medication Workflows, Increase Adherence, and Lower Costs with Vim Rx Assist

Vim's Rx Assist solution is an easy-to-use application that helps stakeholders better manage patient-specific medication workflows, improve medication adherence and adoption, and reduce the total cost of care. Our solution surfaces patient-specific medication adjustment recommendations and insights at the point of care within existing EHR workflows.

Vim's in-EHR application delivers our customers' Rx recommendation data within the context of the patient chart to:

Lower the total cost of care, save the patient money, and better manage dollars at risk by presenting Rx adjustment opportunities at the point of care.

Improve medication adherence by exposing clinicians to pricing transparency and other data that may affect patient behavior.

Reduce provider admin burden caused by managing out-of-workflow Rx recommendation channels such as faxes, and spreadsheets.

Empower provider clinical decision making with patient-specific data and gain visibility into prescribing behavior and cost impact across your network.
