## Vim Care Gaps: Achieve Higher Quality Care and Less Burden

With Vim Care Gaps, quality gap data such as HEDIS is easily and seamlessly connected to the EHR for improved quality score performance at the point of care. Users stay in workflow longer and save time and effort on quality opportunities compared to manual searches through portals and spreadsheets.

Quality measures are integrated into a clinician's existing EHR workflows resulting in the ability to deliver high-value care and address more gaps with fewer clicks and pre-visit prep time.

**Increase** a care team's time spent on quality care instead of pre-charting time and searching through portals, spreadsheets and other data silos to determine a patient's care needs.

**Build alignment** between delivery of care and payer-specific quality measures for improved provider and patient experience and performance.

**Expand visibility** of a patient's health needs and encourage delivery of higher quality care more systematically and with less burden.
