# Improve condition documentation for risk scoring and value-based care performance with Vim's Diagnosis Gap solution

Vim embeds suspected diagnoses directly into providers EHRs for enhanced clinical awareness and data capture.

Accurate diagnosis capture is critical for payers and providers working under value or risk-based contracts. Current diagnosis gap files are static and interfaces are inconsistent, leading to high administrative burden and missed opportunities for accurate risk scoring.

Vim helps providers quickly identify and address diagnosis gaps by placing up-to-date and actionable **gap notifications - sourced from analytics from Vim's payer partners or from internal provider organization data sources - directly into EHR workflows.**

Real-time payer or provider file connectivity replaces static gap files

Augments existing EHR interface, replacing pre-visit prep based on separate portals and printed lists

UI enhancement **saves providers clicks and time** by connecting data to workflows

Vim's point of care connection platform is trusted by leading providers and health plans
